

Paradox Alarm

Keypads

There are three different types of keypads LED, LCD and Touch Screen keypads. The Touch Screen keypad comes in two different sizes 5" and 7" (which is the best seller out of the two).

LED keypad displays the system status and trouble conditions via the LEDs on the keypad which often requires referring to the user manual to know what condition in your system each LED represents. The LCD keypad is a full descriptive text keypad, it displays the system status and trouble conditions in text format and most often you don't need to refer to the user manual.

The Touch Screen keypad gives you a whole range of features and information on your entire security system, from which alarm was triggered in which room, to the real-time status of every area and zone in your installation, to any possible activity in your system.
